Project Summary

Project Title

Casino Island Simulator

Team Leader

Joshua Lawrinenko

Members

Joshua Lawrinenko, Bhuwan Joshi, Hayden Northwick, Thomas Huynh, Youwon Song

Project Description

Our project is a website that hosts several different casino/card games. The website allows the users to have an account and a balance tied to the account.

Goals

- Create an easy-to-follow website where players can interact with various games
- Have a backend manage user accounts
    - This includes login information and user balance
- Make it easy for site administrators to manage the website and read user feedback

Outcomes

- An online casino website. Users will be able to interact with several games and manage account information. Games available will likely be 2D, simple browser games
- Account information will include the ability to add funds (likely simulated to avoid legal issues), change usernames and passwords. A daily highscore feature will keep track of the user with the highest daily profits. No multiplayer functionality is planned. Account based games will allow you to keep track of your own progress and save your balance.

Benefits

- Understand and implement basic principles of UI design
- Learn basic frontend languages and tools like JavaScript, HTML, etc.
- Learn basic backend MySQL, Spring Boot, Internet Protocols, etc.
- Work with a team to deliver a product
    - Acquire communication skills and improve conflict management
    - Comprehend and apply various workflows
    - Develop modular design/development skills

Limitations

- Multiplayer functionality would be ideal, however, will likely not be possible to implement
- It must remain clear that this is a “for fun” website, no actual transactions of any kind will be taking place. This limits the fun of the website
- Graphic design will likely be a weak point for our team of software developers

Personas / Actors

Players

Goals

- Players want to interact with the different games hosted on the website
- It should be as easy as possible to play the different games and update balance

Motivation

- Players are motivated by entertainment, i.e. fun and engaging games
- Players could also be motivated by “winning” money

Developers

Goals

- Developers want to easily develop and maintain the website
- They also aim to make the website as attractive as possible to draw and keep players

Motivation

- Developers are motivated to develop and maintain the website for the sake of improving the experience of the player, hopefully retaining them and drawing in new players
- Developers want the website to run smoothly as possible with little effort, i.e. efficiency
